

MessengerConsole®

automated monitoring of multiple systems

Organizations with multiple servers and partitions need centralized control for managing activities across local and remote Power Systems™ servers running IBM i. MessengerConsole bring the benefits of MessengerPlus to your network with monitoring, message management, notification, and statistical reporting—all from a single point of control. MessengerConsole helps you manage your network more efficiently and cost-effectively.

Remote Monitoring

- Ensures consistency across your network.
- Provides real-time monitoring.
- Does not require continuous connectivity.
- Manages remote systems from a central location.

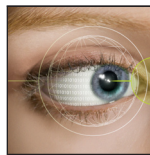

Simplified Management

- Maintains monitoring from a single system.
- Distributes changes to remote systems automatically.
- Ensures consistency of monitoring policies.
- Secures distributed monitors at remote sites.

The Alternate Console

- Mirrors to a backup or alternate console.
- Switches from primary to alternate console in emergencies.
- Allows planned outages.
- Reduces downtime and data loss.

Watches Your Entire Network

- Collects events from multiple systems.
- Simplifies management of remote systems.
- Reduces downtime from unanswered messages.
- Simplifies troubleshooting by consolidating events.

Monitoring And Alerts

- Reduces remote monitoring setup time.
- Sends alerts from a central system.
- Sends only important events from remote systems.
- Automates message handling throughout the network.
